

CLAIMS

1. An agent for controlling Bcl-2 expression comprising ginsenoside F1 as an active component.

5

2. The agent according to claim 1, wherein the Bcl-2 expression is controlled because the ginsenoside F1 controls Brn-3a expression.

3. Apoptosis inhibitor comprising ginsenoside F1 as an active component,
10 which inhibits apoptosis induced by low-dose ultraviolet radiation.

4. The apoptosis inhibitor according to claim 1, wherein the apoptosis is inhibited because the ginsenoside F1 inhibits decrease of Bcl-2 expression.

15 5. Apoptosis promoter comprising ginsenoside F1 as an active component, which promotes apoptosis induced by high-dose ultraviolet radiation.

6. An agent for controlling Brn-3a expression comprising ginsenoside F1 as an active component.
